### **DETAILED ACTION**

1. This office action is in Request for Continued Examination filed on April 10, 2008, in which claims 1, 2, 10, 14-18, 23, 25, 27-33 and 35-48 presented for further examination.

### **INFORMATION DISCLOSURE STATEMENT**

2. The information disclosure statement (IDS) filed on April 10, 2008 complies with the provisions of M.P.E.P 609. It has been placed in the application file. The information referred to therein has been considered as to the merits.

### **EXAMINER'S AMENDMENT**

3. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Sanders N. Hillis (Reg. No. 45,712) on November 7, 2007.

The application has been amended as follows:

#### **In the claim:**

25. (Currently Amended) The method of claim ~~24~~ 23 wherein the segmentation parameters comprise an origin, of the majority of the data requests.

27. (Currently Amended) The method of claim ~~26~~ 23 wherein the segmentation parameters comprise determination of a plurality of related subject matter areas.

***Allowable Subject Matter***

4. The present application has been thoroughly reviewed. Upon searching a variety of databases, the examiner respectfully submits that claims 1, 2, 10, 14-18, 23, 25, 27-33 and 35-48 are allowable in light of the terminal disclaimer and in light of the prior art made of record.

***Reason For Indicating Allowable subject Matter***

5. The following is an examiner's Statement of Reasons for Allowance: The present invention is directed to a distributed data in a netcentric computing system that requires some form of distribution strategy to allow efficient and cost effective operation, wherein the distribution strategies is described as a segmented data distribution system and a replicated data distribution system. Segmentation and replication strategies are used individually or together to fulfill the business requirements. In general, data replication produces data that is replicated from data stored in a central database, whereas, data segmentation produces data that is partitioned into segments, that together represent a total data present in the netcentric computing system. The combined use of data replication and data segmentation produces selectively distributed data, which is a predetermined portion of the data that is produced by segmenting the central database and then replicating the segmented portion of the central database for storage in one or more locations, wherein segmentation is a process of dividing the data for the netcentric computing system into multiple pieces, or segments. The segmentation strategy can be horizontal segmentation and vertical segmentation or a combination of both. The vertical segmentation

strategy is storing related subject matter areas on different database servers, wherein these segments are often viewed as subject database, since they are located together based on the type of data contained therein, not segmentation key or similar master identifier and uses in breaking up a large database into smaller subject areas, whereas a horizontal segmentation strategy vertical segmentation strategy reflects the natural way to partition data that is in line with the way the applications of the enterprise structure their transactions and uses a segmentation key to uniquely identify records in the central database and provide superior solution when the data access model is consistent for the various applications and locations. The closest prior art, Meisl et al., (article entitled, "Parallel synthetic aperture radar processing on workstation"), however, is directed to a similar system for obtaining high resolution images of the earth's surface using a combination of vertical and horizontal partitioning SAR processing strategies in the synthetic Aperture radar signal processing. A vertical partitioning processing is partitioned vertically through the use of pipelining, where the throughput of the processor increases without increasing its latency (see fig.5), whereas, horizontal partitioning divides the data set among the processors, wherein each processor performs essentially identical operations on subsets of the data (see fig.6). However, Meisl either singularly or in combination, fail to anticipate or render obvious the recited features "database located within each of the data stores, wherein the databases in each of the data stores are representative of a segment of data in the netcentric computing system, and wherein the data is horizontally segmented with a segmentation key and also vertically segmented to form the segment of data included in each of the databases, wherein the segmentation key is operable to uniquely define records across the database in each of the data stores". These features, in conjunction with all other limitations of the dependents and

independent claims render claims 1, 2, 10, 14-18, 23, 25, 27-33 and 35-48 allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance".
